A GUIDE TO SOY PROTEIN'S MARKET OPPORTUNITIES AND FUTURE

A Guide to Soy Protein's Market Status, Market Drivers, Growth Factors, Opportunities and Future

In the last few years, due to increased demand for vegetarian food and rising awareness about dietary supplements, the global demand for soy protein has been growing. As a result, the market for soy protein products has been fragmented with the presence of a large number of manufacturers — quite natural owing to the swift shift towards the preparation of vegetarian dishes, especially in highly-populated and developing nations like China and India.

Consumer awareness about healthy food consumption has significantly contributed to the growth in this market, leading to a surge in demand for protein-rich vegetarian foods. In 2018 alone, the interest in plant-based substitutes for meat increased by 25%. And the rising health benefits have only acted as catalysts to this surge. In that light, it becomes imperative to analyse this market and profoundly monitor the growth opportunities for 2021 and beyond.

An Insight into the Soy Protein Business

With the help of modern technology, it is now possible to extract protein from most plants that were previously used to be discarded as waste by-products. Plant proteins are a preferred source of readily available protein for food manufacturers as they constitute an eco-friendly source of protein that helps save precious resources.

That said, soy protein products have found themselves being employed in several industries over the years, including food processing, domestic, pharmaceuticals, and other processing industries. Such is the prominence of the soy protein business that the market, especially for textured Soy protein, is expected to grow incomparably over the next few years.

LED BULB MANUFACTURING UNIT

A light emitting diode (LED) is a device which converts electrical energy to light energy. LEDs are preferred light sources for short distance (local area) optical fiber network because they are inexpensive, robust and have long life (the long life of an LED is primarily due to its being a cold device, i.e. its operating temperature being much lower than that of, say, an incandescent lamp), can be modulated (i.e. switched on and off) at high speeds (this property of an LED is also due to its being a cold device as it does not have to overcome thermal inertia), couple enough output power over a small area to couple to fibers (though the output spectrum is wider than other sources such as laser diodes).

A light-emitting diode (LED) is a two-lead semiconductor light source. It is a p-n junction diode, which emits light when activated.[4] When a suitable voltage is applied to the leads, electrons are able to recombine with electron holes within the device, releasing energy in the form of photons. This effect is called electroluminescence, and the color of the light (corresponding to the energy of the photon) is determined by the energy band gap of the semiconductor.

Types of LED

(1) Miniature

Very small (1.6x1.6x0.35 mm) red, green, and blue surface mount miniature LED package with gold wire bonding details. These are mostly single-die LEDs used as indicators, and they come in various sizes from 2 mm to 8 mm, through-hole and surface mount packages.

CEILING FAN

A ceiling fan is a device suspended from the ceiling of a room, with hub-mounted rotating blades that circulate the air, thereby producing a cooling or destratification effect. Most ceiling fans have an electrical switch that allows one to reverse the direction of rotation of the blades.

The electric motor is the electric machine within the ceiling fan that converts electrical energy into mechanical energy. The ceiling fan capacitor torques up the electric motor, allowing it to start and run. An electrical current reaches the motor and then enters coils of wire that are wrapped around a metal base. As this current passes through the wire, a magnetic field is caused that expends force in a clockwise motion that actually changes the electric energy into mechanical energy. This action causes the motor coils to spin. As the coils are spinning, the fan captures this spinning motion, transferring it to the fan blades.

Fans do not actually cool air (if anything, electric fans warm it slightly due to the warming of their motors), but the breeze created by a ceiling fan speeds the evaporation of sweat on human skin, which makes the body feel cool. Thus, fans may become ineffective at cooling the body if the surrounding air is near body temperature and contains high humidity.

Ceiling fans are very commonly used for circulation of air in a room to bring the cooling purpose easier. Due to circulation of air in a room, the cooling rate increases and we feel cool and less suffocation. When the air is circulated, air comes from other place and due to this the room becomes cool.

ALUMINIUM COMPOSITE PANEL

Aluminium Composite Panels (ACP) are mainly light-weight composite material consisting of two pre-finished aluminium cover sheets heat-bonded (laminated) to a core made of polyethylene plastic material, available in 3mm, 4mm, and 6mm thicknesses after finishing and can be curved and bent to form corners. These panels are used widely as exterior covering of commercial buildings and corporate houses. While adding to aesthetic beauty of the structure, they are also resistant to acid, alkali salt spray, pollution and provide good thermal as well as sound insulation. These Panels are widely used due easy maintenance in almost any kind of climate through normal wash with water and mild detergent that ensures long lasting performance.

Aluminium Composite Panels consist of two thin sheets of aluminium continuously bonded to a polyethylene core. This polyethylene core of the aluminium composite panel is faced with two thin sheets of aluminium. The aluminium is bonded onto the core during the manufacturing process and it is virtually impossible to separate the layers of material once they have been bonded

WASHING POWDER AND WASHING SOAP

Synthetic detergents occupy a vital place in the present age particularly when the modern society is constantly looking for quick, effective and economic cleaning agents. Synthetic detergents emerged as a regular industry after Second World War only. The development of this industry is closely linked with Petro-chemical industry which forms the basis for its raw materials.

Detergents when dissolved in water, acquire better cleaning properties and hence facilitates easy removal of dirt & dust and grease etc.

Apart from their use in clothes washing, detergents also have applications in the following industries.

1. In industry, in laundry and dry cleaning.
2. In textile processing, grain milling, metal plating and foods canning.
3. In dairy foods and beverages processing and in restaurants.
4. In plant maintenance and industrial house-keeping.

The principal types of synthetic detergents are an ionic, non-ionic and employtics. Sodium dodecyle benzene sulpho-nate is an example of the ionic type while nylon phenol, nylon oxide obtained from ethylene oxide is the non-ionic type. The amplyotic detergents like the alkyl amino propionates behave as cations in acidic solutions and like anions in alkaline solution.

Among the numerous detergent powders are available today in the market e.g. Hipoline, T.Series, Areal, Rin, Ghari, Surf, Sunlight, Nirma, Wheel detergent powder is most popular.

REMOTE CAR TOY

A toy is an item that is used in play, especially one designed for such use. Playing with toys can be an enjoyable means of training young children for life in society. Different materials like wood, clay, paper, and plastic are used to make toys. Many items are designed to serve as toys, but goods produced for other purposes can also be used. For instance, a small child may fold an ordinary piece of paper into an airplane shape and "fly it". Newer forms of toys include interactive digital entertainment. Some toys are produced primarily as collectors' items and are intended for display only.

The origin of toys is prehistoric; dolls representing infants, animals, and soldiers, as well as representations of tools used by adults are readily found at archaeological sites. The origin of the word "toy" is unknown, but it is believed that it was first used in the 14th century. Toys are mainly made for children. The oldest known doll toy is thought to be 4,000 years old.

Playing with toys is considered to be important when it comes to growing up and learning about the world around us. Younger children use toys to discover their identity, help their bodies grow strong, learn cause and effect, explore relationships, and practice skills they will need as adults. Adults on occasion use toys to form and strengthen social bonds, teach, help in therapy, and to remember and reinforce lessons from their youth.

The very word toy makes you remind of your childhood. The toys are categorized into many in India and the plastic toys have a market share of nearly 80% of the total toy industry in the country. Other types of toys available in the market are fabric toys, paper toys, and wooden toys, metal toys and DIY toys (containing arts and craft toys) that are manufactured mostly by the cottage industry. However, out of these the metal toys are considered to be sharp toys which are harmful for children and a hindrance in their safety, that is why these toys are known to be slowly losing its popularity. Another popular category of toys seen today are educational toys and activity toys which help build the mind and body of the child, then there are soft toys, Electronic toys, battery operated toys and board games like chess and monopoly. There are different types of Electronic toys available in the market. Electronic toys with or remote, walkie talkie sets for kids, toy radios, musical toys, hand-held video games, video games used with T.V, Arcade entertainment products, educational toys etc are popular among Indian children.

This report is about a remote controlled car toy. There are a number of Remote controlled Toys in the market. These, include Cars, trucks, playing machines and other equipments. There are differences in the mechanical assembly of these types of toys but the basic Electronic principle is the same. These types of toys have four main units i.e., Transmitter, Receiver, Motor and Power Source. The transmitter sends radio wave which is received by the receiver which is fitted with an antenna. These signals are used to activate the motor. The power source is typically a rechargeable battery pack, but sometimes it's just normal batteries.

India's urban population is the second largest in the world—larger than the combined urban populations of all countries except China, the US and Russia. India has more than 800 Indian toys and games manufacturers, suppliers and exporters, most of who hail from the unorganized sector. The Indian toy industry, fuelled by the vast domestic market, has now turned its attention to global markets and is fast gearing up to meet international standards and demands.

The Indian toy industry is driven by skilled workforce, diverse product range, growing innovation and creativity, and emphasis on technology-driven learning and education. It is set to grow at 25 per cent in the coming years and is beginning to export to a few developed nations around the world. The worldwide market for toys is huge and offers a plethora of potential for companies to pursue. But the interests of children, who are the primary consumers for toys, are changing faster than ever. Toy manufacturers have to create innovative toys to capture their interests.

Toys these days are popular not only among kids, but adults too have entered this field through the medium of sports and games. Many sports and games are played by adults at national and international levels representing their respective countries.

SALT, BROMINE AND POTASSIUM CHLORIDE

Salt was the name originally given to the residue left by evaporation of sea water. Afterwards the name was employed to include all substances held in solution in sea water. Chemists ultimately extended the name to cover all combinations of an acid and a base. Sodium chloride (NaCl) now called common salt, is an example of the simplest type of chemical salt.

Sodium chloride, common salt, is essential to human life. Our bodies contain up to 450 grams of salt and we need to take in a few grams each week to stay healthy. The value of salt can be seen in the way Roman soldiers used to be paid in salt, leading to the phrase "worth his salt" and our word "salary". The growth of industry has increased the demand for salt, both for direct use and as a raw material for producing other chemicals.

Throughout the world the main sources of salt are sea water, lake water and rock salt deposits. Salt is recovered from the sea and lakes by evaporation. Rock salt may be mined like coal, or recovered by drilling wells into the salt bed, forcing down pure water and pumping up the saturated brine which forms.

It is a deep red fuming liquid, member of the halogen elements as Group VII of the periodic table that is liquid at ordinary temperature and pressure. Rare element bromine is found in nature dispersed throughout the earth crust only in compounds such as soluble and insoluble bromides. The chief commercial source of bromine is ocean water from which the element is extracted by means of chemical replacement (oxidation) by more active chlorine. Bromine has traditionally been manufactured as a byproduct from saline mother liquors (bitterns) left after the crystallization of the main salt products.

DETAILS OF RAW MATERIALS

The properties of bromine are significantly different from those of fluorine and chlorine. Discovered in the early 19th century, in the form of its salts (bromides) in the bitterns remaining after evaporating sea water and extracting the sodium chloride, it was obtained later from Stassfurt, Germany, as a byproduct in the production of potassium salts and from other deposits and salt lakes.

Its main use was originally for bromides in medicine still a minor use. Bromine first because of industrial importance with the development of modern photographic process, in which the light sensitive material is an emulsion of minute particles of

silver bromide (together with silver chloride or iodide or both) in gelatin.

For a time, the expanding world automobile industry. Threatened a scarcity of bromine, obtained from brines, which contained about 0.5% bromine. To meet the demand, it was necessary to turn to sea water which contains about 70 ppm bromine.

The chief sources of bromine are sea water, brines and betterns and the natural deposits of potassium salts. In these, it is present in very small quantities in the combined state. Sea-water contains, 66 parts per million (0.0066%) of bromine and in 1933, the DOW Chemical Co., (U.S.A.) developed a process for its recovery. Large quantities of bromine are now being produced both from the sea and from the salt & lakes. The U.S.A. is now the world largest producer and used the entire output for the manufacture of ethylene bromine.

The other prominent bromine producing countries are Germany and France.

Bromine, a heavy, mobile, reddish-brown liquid with an interesting irritating odour, is the only non-metallic element that is a liquid at normal temperature. It is a diatomic molecule with the chemical formula Br₂

The bromine available for extraction occurs as bromide in the ocean, in salt lakes and in brine or saline deposits left by evaporation of such waters by solar heat. Sea bitterns, the left over concentrated solution after the crystallizing out of salt from the sea water, are very rich in bromine and offer a good raw material for the manufacture of bromine. Bromine is extracted from seawater.

Potassium Chloride occurs naturally as Sylvite. However in general potassium compounds are recorded as valuable article of commerce.
