## Market size of baby food industry in India

The demands for baby food industries are increasing day by day in Indian markets due to rising awareness. Since the purchasing power of consumers are changing these days, baby food manufacturers focus more on various factors to enhance their productivity. The milk based food products are the largest selling products in the markets followed by dried baby items and other items. On the other hand, the distribution of food products may vary from one region to another region that requires a proper research. The baby market items are expecting a huge growth in coming years that will contribute more to Indian economy.

**The global baby infant formula market size is estimated to be USD 24,043 Million in 2018 and is projected to reach USD 45,348 Million by 2025, registering a CAGR of 9.5% from 2018 to 2025.**

### Reasons for the growth of baby food industries

Baby food products are selling fast in the markets owing to consumer behaviour and growing concerns. The manufacturers aim at introducing products which aim at fulfilling the needs of customers. Moreover, consumers are becoming aware of nutritional requirements when they feed their babies. This made the production firms to understand more about the choices of consumers in detail. They even offer foods designed for every growing stage of an adult that provides proper nutrition. In fact, infant milk products are getting popularity because they are a perfect choice for infants to improve their growth.

### Major players of baby food products in India

Nestle India is the leading baby food supplier in India which offers a variety of products for infants. It continues to dominate in baby food industry due o high quality products and other factors. The southern region in India contributes more to high revenues compared to northern region and eastern region. The average per capita consumption is increasing year by year which see a significant rise in growth rates. At the same time, manufacturers aim at offering products after studying the preferences of customers.

### Growth of baby food industries in India

The growth rates of baby food industries will increase in the future markets. Apart from that, manufacturers will develop new products in the future to reach more customers

Numerous aloe species around the world are used for conditions ranging from dermatitis to cancer. Aloe gel's greatest use is as a skin salve and vulnerary for minor burns, abrasions, canker sores and other epithelial injuries. There is growing experimental evidence for its use as an antiviral, an ulcer remedy and an adjuvant cancer treatment due to its immune modulating effects. Aloe latex is a potent laxative that can cause severe cramping and diarrhea; it should not be used during pregnancy, lactation or by children less than 12 years old. Allergic reactions to aloe have been reported. Long-term use of anthraquinone laxatives may result in laxative dependence, pseudomelanosis coli, dehydration, potassium depletion, weakness, and arrhythmias. Aloe should not be used as a laxative by persons with undiagnosed abdominal pain, appendicitis, or intestinal obstruction.

## ETHYL ACETATE [EIRI/EDPR/3979] J.C.: 2107XL

### INTRODUCTION

**E**thyl acetate also called as acetic ether, acetic ester and vinegar naphtha is chemically represented by the formula  $CH_3COOC_2H_5$ . It is a colorless fragrant liquid having density 0.8945 g/ml (25°C). Ethyl acetate is derived by heating Acetic Acid & Ethyl alcohol in presence of sulphuric acid and distilling. India has been a world pioneer in the field of alcohol based chemical industries. The growth of alcohol industry in India was in 3 distinct phases. The period 1937-47 was an exploratory phase into the industrial possibilities of rectified spirit. Growth of distilleries marked the second phase (1947-62) when the mainstay of the Industry was the offtake of power alcohol in India is used for industrial purposes particularly in the manufacture of acetone, acetaldehyde acetic acid, butanol, vinyl chloride and ethylacetate. Alcohol has been an important industrial raw material and more attention has come to be focussed on alcohol in recent days.

Ethyl acetate requirement as general solvent in coatings, plastics organic synthesis and manufacture of smokeless powders, pharmaceuticals have made the chemical valuable product. Various grades of Ethyl Acetate are marketed. The anhydrous compound B.P 76-77°C is 99% purity and is inexpensive and suitable for most purposes. The 95-98% grade usually containing some water, ethyl alcohol and acetic acid and may be fractional distillation.

## SOLAR MODULE MANUFACTURING UNIT (250-300 MW/ANNUM) [EIRI/EDPR/3980] J.C.: 2108XL

**P**V Module or Solar PV Module is an assembly of photovoltaic (PV) cells, also known as solar cells. To achieve a required

voltage and current, a group of PV modules (also called PV panels) are wired into large array that called PV array. A PV module is the essential component of any PV system that converts sunlight directly into direct current (DC) electricity. PV modules can be wired together in series and/or parallel to deliver voltage and current in a particular system requires.

PV is emerging as a major power resource, steadily becoming more affordable and proving to be more reliable than utilities. Photovoltaic power promises a brighter, cleaner future for our children.

Using the technology we have today we could equal the entire electric production of the United States with photovoltaic power plants using only about 12,000 square miles.

In 1839, Edmund Becquerel discovered the process of using sunlight to produce an electric current in a solid material, but it wasn't until a century later that scientists eventually learned that the photovoltaic effect caused certain materials to convert light energy into electrical energy.

The photovoltaic effect is the basic principal process by which a PV cell converts sunlight into electricity. When light shines on a PV cell, it may be reflected, absorbed, or pass right through. The absorbed light generates electricity.

In the early 1950s, photovoltaic (PV) cells were developed as a spin-off of transistor technology. Very thin layers of pure silicon are impregnated with tiny amounts of other elements. When exposed to sunlight, small amounts of electricity are produced. Originally this technology was a costly source of power for satellites but it has steadily come down in price making it affordable to power homes and businesses.

Photovoltaic cells are connected electrically in series and/or parallel circuits to produce higher voltages, currents and power levels. Photovoltaic modules consist of PV cell circuits sealed in an environmentally protective laminate, and are the fundamental building blocks of PV systems. Photovoltaic panels include one or more PV modules assembled as a pre-wired, field-installable unit. A photovoltaic array is the complete power-generating unit, consisting of any number of PV modules and panels.

## BLOOD BAGS (DISPOSABLE) [EIRI/EDPR/3985] J.C.: 2114XL

**B**lood bag is a disposable bio-medical device used for collection, storage, transportation and transfusion of human blood components. The system consists of a single or multiple bags connected with tubing, needle cover, clamp etc. The Blood Bags are made of plastic-material, which are compatible with blood.

The introduction of flexible PVC bags for the storage of blood and its components totally replaced the use of glass bottles because of its numerous advantages. Blood Bags enable better separation of blood components in a more sterile manner and safer transfusion of components. This has led to increasingly wider use of blood component therapy than whole blood use, thus enabling more effective use of the scarce donor blood that is available.

Blood Bags can successfully replace the use of glass bottles for collection, storage, transportation and transfusion of blood and blood components since bottles require exhaustive cleaning, rinsing and autoclaving procedures and there are chances of breakage at any stage. Further, use of disposable bags eliminates the possibility of any contaminations.

Blood Bags contain an anticoagulant solution and a red blood cell preservative solution, and are used in blood banks which both collect donor blood and separate blood components. Blood bags are made from imported, medical grade PVC granules & sheets in class 10000 clean room environments.

Increase in the healthcare facilities will further act as a driver for the growth of medical devices sector in India. The blood bag market is expected to grow further in the coming years owing to continuous developments and rising demand for better blood collection technology. As a whole it is a good project for new entrepreneurs to invest.

The system consists of a single or multiple bag connected with tubings, needle, needle cover, clamp etc. The Blood Bags are made of plastic-material which is compatible with blood.

Blood (Human blood):-

Blood is a complex, liquid tissue of sp. gr. 1.056 and pH of 7.35-7.45. It is comprised of erythrocytes (red cells), leucocytes (white cells), platelets, plasma proteins and serum. The plasma fraction (55-70%) is whole blood from which the red cells have been removed by centrifuging. Plasma is the seat of the clotting mechanism in which fibrinogen is converted into fibrin by the activated enzyme thrombin (q.v.). Besides fibrinogen, plasma contains over 40 proteins (including albumin and globulin), acids, lipids and metallic ions. Hemoglobin (q.v.) is a protein found in the erythrocytes; it contains the essential iron atom and functions as the transport agent for oxygen to the heart (artery) and of carbon dioxide from the heart (vein). Experimental work has been reported on the effectiveness of fluorocarbon compounds in carrying out the essential transport functions of blood, especially of the red cells. This may indicate a new mode of attack on anemia and leukemia.

## SMALL VOLUME PARENTERAL (SVP) [EIRI/EDPR/3988] J.C.: 2117XL

**A**n injection that is packed in containers labelled as containing 100 ml or less.

All the sterile product packaged in vial ampoules cartridges, syringes bottles or any other container in the 100ml or less falls under the class of Svp (Small volume Parenteral)

- They are supplied in single or multiple doses.
- They are used to dispense most of the drugs.

There are several types of IV fluids that have different effects on the body. Some IV fluids are designed to stay in the intravascular space (intra, within; vascular, blood vessels) to increase the intravascular volume, or volume of circulating blood. Other IV fluids are specifically designed so the fluid leaves the

intravascular space and enters the interstitial and intracellular spaces. Still others are created to distribute evenly between the intravascular, interstitial, and cellular spaces. The properties that an IV solution has within the body depends on how it is created and the specific materials it contains. It also determines the best type of IV solution to use in relation to the patient's needs.

The majority of an IV solution is sterile water. Chemically, water is referred to as a "solvent." A solvent is a substance that dissolves other materials called "solutes." Within IV solutions, the solutes can be molecules called electrolytes (charged particles such as sodium, potassium, and chloride) and/or other larger compounds such as proteins or molecules.

Today, a growing number of pharmaceutical manufacturers are using advanced aseptic processing technologies to minimize operator intervention and contamination risk in the filling and packaging of liquid parenteral drugs. One of these technologies is form-fill-seal (FFS), in which a polymeric material is formed and sealed inline to a container of choice, while the container is being filled.

FFS offers cost savings over conventional aseptic processing in glass. Traditional parenteral filling and packaging requires 23 steps and individual machines for filling, stoppering and capping. In contrast, FFS requires one piece of automated machinery, and takes place in six seconds or less ■

## FABRICATION PLANT FOR LATTICE TOWERS AND TUBELAR STEEL POLES [EIRI/EDPR/3997] J.C.: 2127XL

**T**owers or masts are built in order to fulfil the need for placing objects or persons at a certain level above the ground. Typical examples are:

Single towers for antennae, floodlight projectors or platforms for inspection, supervision or tourist purposes.

Systems of towers and wires serving transport purposes, such as ski lifts, ropeways, or power transmission lines.

For all kinds of towers the designer should thoroughly study the user's functional requirements in order to reach the best possible design for the particular structure. For example, it is extremely important to keep the flexural and torsional rotations of an antenna tower within narrow limits in order to ensure the proper functioning of the equipment.

The characteristic dimension of a tower is its height. It is usually several times larger than the horizontal dimensions. Frequently the area which may be occupied at ground level is very limited and, thus, rather slender structures are commonly used.

Another characteristic feature is that a major part of the tower design load comes from the wind force on the tower itself and its equipment, including wires suspended by the tower. To provide the necessary flexural rigidity and, at the same time, keeping the area exposed to the wind as small as possible, lattice structures are frequently preferred to more compact 'solid' structures

Bearing in mind these circumstances, it is not surprising to find that the design problems are almost the same irrespective of the purpose to be served by the tower. Typical design problems are:

- Establishment of load requirements.
- Consistency between loads and tower design.
- Establishment of overall design, including choice of number of tower legs.
- Consistency between overall design and detailing.
- Detailing with or without node eccentricities.
- Sectioning of structure for transport and erection.

A lattice tower, also called angle steel tower or electrical tower, is one kind of freestanding framework tower for power transmission line of all voltages, often designed as a space frame or a hyperboloid structure. They are widely used as an

electricity transmission towers especially for voltages above 100 kilovolts, being as a self-radiating tower or a carrier of aerials, even an observation tower.

### CALCIUM GLUCONATE [EIRI/DFR/3998] J.C.: 2128XL

Calcium gluconate contains not less than 8.8% and not more than 9.5% calcium corresponding to the formula  $\text{Ca}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot \text{H}_2\text{O}$ . Calcium gluconate is used as a source of calcium iron for oral intravenous and intramuscular use. This is much superior to calcium chloride in that it tastes better and is much less irritating. Calcium gluconate also finds extensive use in the treatment of milk fever in cows and low calcium tetany.

Calcium gluconate is a derivate of gluconic acid and commercially known as calcium salts of gluconic acid. The market for calcium gluconate is driven by the increased demand from the health supplement category, where the growing aging population and increased calcium deficient. Also, the approval of GRAS status has increased its usage as a food additive since it can be used as a bulking agent, emulsifier, and thickening agent, its usage in the food and beverage segment increases.

On a segmentation front by application, pharmaceutical industries account for the largest share of the market owing to its benefits in the medical treatment.

However, certain factors that are affecting the market growth are the excessive consumption of calcium gluconate results in nausea, vomiting, constipation, decreased appetite, and dry mouth that acts as a restraint for the market. Moreover, the different food regulatory constraints that hinder the product formulation and labeling requirements are also affecting the market.

### AAC BLOCK MANUFACTURING PLANT [EIRI/EDPR/4004] J.C.: 2134

AAC blocks are light weight Aerated Autoclave Concrete Block. It is manufactured through a reaction of aluminium powder and a proportionate blend of lime, cement, and fly ash or sand. Autoclaved aerated concrete (AAC) is a lightweight cellular concrete that has been used for more than 80 years. Currently, however, no good recycling options for AAC from construction and waste exist. During this process, the hydrogen gas escapes create lots (billions) of tiny air cells, applying AAC with a strong cellular structure. The hydrogen gas or bubbles cause the concrete to expand to roughly thrice times its original volume, further strengthened by high pressure steam curing. The product thus formed is not only light weight concrete but also has higher compressive strength. AAC is a masonry material that is lightweight, easy to construct, and economical to transport. AAC is one of the materials which can cope up with the shortage of building raw materials and can produce a light weight, energy efficient and environmentally friendly concrete. This study deals with the manufacturing process of the autoclaved aerated concrete blocks.

Autoclave aerated concrete blocks are also known as Autoclaved light weight concrete (ALC) Autoclaved Aerated Concrete (AAC) is one of the eco – friendly and certified green building materials. AAC was perfected in the mid of 1920s by the Swedish architect. It has become one of the most used building materials in Europe and is rapidly growing in many other countries around the world. Basically, AAC is a mixture of cement, fly ash, sand, water, and aluminum powder. When the materials are proportionally weighed, AAC is using no aggregate larger than sand. Here, Aluminum powder reacts with calcium hydroxide and water to form  $\text{H}_2$ . The hydrogen gas foams and doubles the volume of the raw mix creating gas bubbles shown. At the end

of the foaming process, the hydrogen escapes into the atmosphere and is replaced by air. When the air is removed from the material, it is solid but still soft. It is then cut into blocks and placed in a cylindrical chamber for 11-12 hours.

During this steam pressure hardening process, when the temperature reaches 190°C (374°F) and the pressure reaches to a maximum limit of 12 bar, sand reacts with calcium hydroxide to form calcium silicate hydrate, which gives AAC its high strength and light weight properties, solid but soft in nature. After the autoclaving process, the material is ready for immediate use on the construction site. It has become one of the most used building materials in Europe and is rapidly growing in many other countries around the world. The characteristic of AAC is helpful in green housings and saves fertile lands and a solution for fly ash disposal.

Autoclaved aerated concrete is a versatile lightweight construction material and usually used as blocks. Compared with normal (ie: "dense" concrete) aircrete has a low density and excellent insulation properties.

The low density is achieved by the formation of air voids to produce a cellular structure. These voids are typically 1mm-5mm across and give the material its characteristic appearance. Blocks typically have strengths ranging from 3-9 Nmm<sup>-2</sup> (when tested in accordance with BS EN 771-1:2000). Densities range from about 460 to 750 kg m<sup>-3</sup>; for comparison, medium density concrete blocks have a typical density range of 1350-1500 kg m<sup>-3</sup> and dense concrete blocks a range of 2300-2500 kg m<sup>-3</sup>.

### INNER GROOVED COPPER TUBE [EIRI/EDPR/4045] J.C.: 2178XL

Inner grooved tube is enhanced with grooves by increasing the

inner surface area. Due to its high efficiency of heat transfer, it is used widely in power generation, air conditioning and many other applications. Heat exchanger is one of the example that uses inner grooved tube to enhance rate heat transfer. Precision in production of inner grooved copper tube is very important because it affects the tube's performance due to various tube parameters. Therefore, it is necessary to carry out analysis in optimizing tube performance prior to production in order to avoid unnecessary loss.

Ongoing rise of Air Conditioners and Refrigerators in the market and production in GCC and other part of the world and Heat Transfer Systems in engineering industries and automobile sectors all over the world, makes Copper tubes an essential and unmatched engineering material as Copper possesses superior heat transfer properties with excellent corrosion resistant. Seamless Copper Tubes meeting the specification requirements of ASTM B68, ASTM B280 and JIS H3300 for ACR applications are in a commanding and challenging position in the market. Conventional technology and tube mills are getting outdated as superior new generation software based tube mills have already shaped up and proved their efficiency and quality in production in this technology era and provides platform for producing superior quality tubes. As old companies with conventional machines struggle for their survival, as Quality and Cost are the prime concern governing the market and business world today, new ventures are shaping up and establishing bases to conquer the market. Process technology: An existing plant at Sultanate of Oman cannot hold its position strong as far the market trend is concerned as its lack of symmetry in the process equipments to produce tubes meeting the requirements of primary users. Benefits to use Inner Groove Copper Tube:

1. Leak Proof
2. Long Lasting
3. Accurate Groove Designs
4. Corrosion Resistant
5. High Metallurgical Strength
6. High Temperature Resistant
7. High Pressure Resistant
8. Excellent Heat Transfer Property
9. Good Electrical Conductivity etc.
